

# Tilt Compensation Tool

When is it necessary to adjust the camera tilt compensation tool?

Obviously it is critical to the results of posture pro to have the camera level . I've found the easiest way to do this is to hold a small bubble level on the camera. As you're ready to take the picture look at the level and when the bubble is in the center snapped the picture.

The tilt compensation tool is used when you have no access to a bubble level. By using the tilt compensation tool, as per the instructions in the manual, you can take the tilt out of the camera and the results will be compensated accordingly. So this tool does not rotate the picture but it does adjust the readings to account for camera tilt. Full instructions are in the manual and also in our knowledge base and our online video help library.
