

Why is 200 microamps used for the face when other companies use 600+ microamps?

I cannot speak as to why other companies like 600 or more microamps for facial rejuvenation. But I use 200 because the targets in the face are very shallow and the face usually has less resistance than other areas. When using tips, the energy is very concentrated and you just don't need much microcurrent.

The hardest concept to "own" is microcurrent is sub-sensory. It whispers to the body. You don't need to feel ANYTHING for it to work. Remember that, then read the sentence again and remember it twice.
